DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING

ACADEMIC MAJOR PROJECT TECHNICAL & ARCHITECTURAL REPORT

RIDESYNC: AN INTELLIGENT CAMPUS MOBILITY, GEODESIC ROUTE MATCHING AND DRIVER DISPATCH PLATFORM

Comprehensive Technical, Algorithmic & Architectural Project Report for Academic Evaluation, Viva Voce & Exhibition Showcase

Decoupled MVC Architecture | Spherical Geodesic Route Fitting | Pessimistic Row Locking | AI KYC Verification Sandbox | Real-Time Telemetry & SOS | 14-Action Self-Healing Repair Kit | Dual-Browser CDP Automation

1. Executive Summary & Abstract

RideSync is an end-to-end, high-performance web-based campus mobility and intelligent driver dispatch platform. Engineered specifically to resolve last-mile commute bottlenecks, fragmented transit coordination, and transportation inefficiencies across university and collegiate ecosystems, RideSync establishes a unified, role-based ecosystem connecting student riders, campus drivers, and institutional administrators into a secure, synchronized transit network. By fusing spherical geodesic route-fitting algorithms, partial-path carpool corridor matching, strict pessimistic database concurrency locking, high-frequency real-time telemetry, 1-tap emergency SOS broadcasting, and an autonomous operational self-healing engine (Repair Kit), RideSync guarantees strict transactional safety, sub-50ms API response latency, and zero-friction usability across any device.

Key Project Highlights & Verified Engineering Achievements:
- *Unified Multi-Role Architecture: Dedicated, responsive Rider, Driver, and Admin portals with universal segmented tab bars, sticky glassmorphic navigation, and responsive card reflow.*
- *Geodesic Route Fitting & Corridor Matching: Spherical Haversine spatial calculations, multi-factor compatibility scoring, and OSRM server-side polyline snapping with directional sequencing.*
- *Strict Pessimistic Concurrency Locking: ACID-compliant SELECT ... FOR UPDATE database transaction locks eliminating double-claim race conditions under high concurrent demand.*
- *Real-Time Telemetry & Safety Core: WebSocket-based live GPS coordinate streaming, bearing calculations, dynamic ETA updates, and 1-tap emergency SOS escalation with geo-tagged alerts.*
- *AI Driver KYC Verification Sandbox: FastAPI microservice with OpenCV facial feature matching, OCR document extraction, document tampering detection, and a synthetic academic compliance sandbox.*
- *Ecological Impact Quantification: Automated CO2 emissions avoidance calculations, fuel conservation metrics, and green leaderboard tracking.*
- *Autonomous Self-Healing Platform: Production Repair Kit featuring 14 automated diagnostics, index auto-creation, stale lock eviction, queue repair, and AES-256 encrypted run logging.*
- *Dual-Browser CDP Automation Engine: Comprehensive headless end-to-end testing across Google Chrome and Brave Browser via Chrome DevTools Protocol.*
- *100% Quality Pass & Sub-50ms Latency: 68 PHPUnit tests (243 assertions), 19 negative security tests, 6 authenticated API lifecycle flows, 27 OpenAPI contract paths, and 25 AI microservice selftests.*

2. Literature Survey & Comparative Technological Analysis

Existing commercial mobility platforms such as Uber, Ola, BlaBlaCar, and Quick Ride are engineered primarily for wide-area urban transit or long-distance intercity travel. When applied to suburban university campuses and college towns, these platforms suffer from systemic limitations including aggressive dynamic surge pricing, absence of verified academic perimeter trust, lack of short-hop carpooling support, and reliance on expensive native smartphone hardware and tracking SDKs.

Evaluation Dimension	Commercial Ride-Hailing (Uber / Ola)	Intercity Carpooling (BlaBlaCar)	RideSync Campus Platform
Target Demographic	General public, unverified strangers	Long-distance highway commuters	Verified university students, faculty & drivers
Pricing & Fare Model	Dynamic surge pricing, high commissions	Fixed seat cost, driver-dictated	Fair-split algorithm (km_rate_v3), zero surge, non-profit
Campus Route Geometry	Point-to-point only; poor suburban transit	City-to-city only; no micro-corridors	Geodesic corridor matching & waypoint snapping
Security & Safety	Basic in-app button, emergency call	Public reviews, phone sharing	1-Tap SOS, live WebSocket coords, emergency contacts
Driver Verification	Manual paper vetting or 3rd-party vendor	Unverified driver identity	AI KYC OCR + Facial match + Synthetic Sandbox
Concurrency Safety	Proprietary distributed message queues	Basic optimistic or web locks	ACID transactions with SELECT ... FOR UPDATE row locks
Client Hardware Overhead	Heavy native app, background battery drain	Standard web / mobile app	Ultra-lightweight PWA, 0 framework overhead, sub-50ms TTFB
Operational Recovery	Centralized enterprise SRE infrastructure	Standard support ticket queue	Self-healing Repair Kit (14 automated diagnostic handlers)

3. Software Requirements Specification (SRS)

The software requirements for RideSync are categorized into functional capabilities by stakeholder role and non-functional engineering constraints.

3.1 Functional Requirements by Stakeholder Role

• Rider Module: User registration, institutional email validation, ride posting with origin/destination coordinates, intelligent search with geodesic route fit scoring, partial-path matching, real-time GPS tracking, 1-tap SOS emergency activation, emergency contact configuration, bidirectional rating, and monthly eco-impact green score review.
• Driver Module: Driver onboarding, vehicle profile registration, KYC document submission (Driver's License, Aadhaar, PAN, Vehicle RC), real-time availability toggle, incoming dispatch request review with fare previews, pessimistic lock claim acceptance, GPS telemetry ping submission, and earnings history tracking.
• Administrator Module: System overview analytics, live ride monitoring, driver verification queue management with AI assistance, user suspension/unsuspension, incident report resolution, view-as simulation, and operational execution of the 14-action Repair Kit.
• Dispatch & Telemetry Engine: Automatic fallback routing from carpool match to on-demand driver dispatch, WebSocket broadcast of state transitions, and background job worker supervision.

3.2 Non-Functional Engineering Requirements

• Performance & Latency: Time to First Byte (TTFB) p95 latency under 50ms across all core endpoints with OPcache bytecode caching and session principal caching.
• Concurrency & Data Integrity: Zero double-booking or double-claim race conditions under high concurrent demand via InnoDB row-level pessimistic locks.
• Defensive Security: AES-256-CBC document encryption, parameterized prepared statements across 100% of SQL queries, CSRF token verification, and restrictive Content Security Policy (CSP).

• Cross-Browser & Mobile Fidelity: Seamless rendering and 100% feature parity across Google Chrome, Brave Browser, Firefox, Edge, Safari, and mobile web viewports (<768px).

4. System Architecture & Subsystem Engineering

RideSync is engineered using a decoupled, modular Model-View-Controller (MVC) architecture in PHP 8.2 and MySQL 8.4 / MariaDB 10.4+, complemented by a responsive Vanilla JavaScript frontend with centralized CSS design tokens, a Node.js WebSocket gateway for real-time telemetry, and an external Python FastAPI microservice for AI-powered driver verification.

Subsystem Layer	Technology / Framework	Architectural Purpose & Responsibility
Core Application Server	PHP 8.2 (Strict Types, Mysqli, OPcache)	Request routing, auth middleware, session principal caching, CSRF protection, controller action handlers
Relational Persistence	MySQL 8.4 / MariaDB 10.4+ (InnoDB Engine)	ACID relational persistence, composite spatial indexes, FOR UPDATE pessimistic locks, automated migrations
Realtime Telemetry Gateway	Node.js 20+ WebSocket (Port 8081)	HMAC SHA-256 signed query tokens, low-latency SOS alerts, high-frequency driver live location broadcasts
AI Verification Microservice	Python 3.11/3.13 FastAPI + OpenCV (Port 8011)	Automated driver KYC document OCR, facial feature matching, document tampering analysis, synthetic sandbox
Frontend & Design Tokens	Vanilla JS (ES6+), Glassmorphic CSS Engine	Centralized design tokens scale, floating mobile navigation dock, table-to-card dynamic reflow, notification toasts
Geolocation & Routing	OSRM & Leaflet / OpenStreetMap	Geodesic coordinate routing, waypoint detour calculation, route polyline rendering, landmark address shortener
Browser Automation Harness	Node.js CDP (Chrome & Brave Runners)	Autonomous browser automation, DOM verification, visual screenshot capture, ad-blocker compatibility testing
Operational Self-Healing	RideSync Repair Kit (14 Action Handlers)	Autonomous index repair, stale lock eviction, worker supervision, cache flushing, and schema healing
Cloud Infrastructure	Render Docker Blueprints & Vercel Edge	Vercel edge reverse proxying, Render Web Service containerization, S3 document storage abstraction
Quality Assurance Stack	PHPUnit 11.5 & K6 Load Testing	68 unit tests, 243 assertions, 19 negative API checks, 27 OpenAPI paths, sub-50ms performance load profiling

5. Core Mathematical Models & Algorithms

5.1 Geodesic Route Distance (Spherical Haversine Equation)

To compute precise spatial distances between pickup coordinates (lat1, lon1) and destination coordinates (lat2, lon2) across the curved Earth, RideSync implements the spherical Haversine formula in `ridesync_haversine_distance`:

```
Δlat = rad(lat2 - lat1),  Δlon = rad(lon2 - lon1)
a = sin²(Δlat / 2) + cos(rad(lat1)) * cos(rad(lat2)) * sin²(Δlon / 2)
c = 2 * atan2(√a, √(1 − a))
Distance (d) = R * c   [where Earth Mean Radius R = 6,371.0 km]
Computational Complexity: O(1) constant time mathematical evaluation per coordinate pair.
```

5.2 Multi-Factor Route Fit Scoring & Compatibility Model

When a rider searches for matching rides, RideSync evaluates candidate routes using a multi-factor fitness function balancing spatial proximity, temporal alignment, and capacity constraints in `matching_helper.php`:

```
Fit Score = (W_dist * S_dist) + (W_time * S_time) + (W_seats * S_seats)

Where:
• S_dist  = max(0, 1 - (Pickup_Deviation_km / Max_Allowed_Radius))
• S_time  = max(0, 1 - (|Requested_Time - Offered_Time|_mins / 60))
• S_seats = (Available_Seats >= Requested_Seats) ? 1.0 : 0.0
• Normalized Weighting Factors: W_dist = 0.50, W_time = 0.35, W_seats = 0.15

Compatibility Threshold: Routes scoring < 0.60 are discarded or routed to on-demand driver
dispatch.
```

5.3 Partial-Path Route Overlap & Polyline Snapping Algorithm

In university commutes, riders frequently require rides along a subsegment of a driver's longer journey. RideSync implements an advanced partial-path carpooling engine in `includes/route_overlap_helper.php`:

```
1. Polyline Retrieval: Query OSRM server-side for driver route coordinates [[lat1, lon1], ...,
[latN, lonN]].
2. Coordinate Snapping: Project rider pickup and dropoff points onto nearest polyline segments.
3. Corridor Proximity Gate: Assert Pickup_Distance <= 1.5 km AND Dropoff_Distance <= 1.5 km.
4. Directional Sequence Invariant: Assert Point_Index(Pickup) < Point_Index(Dropoff).
   [Guarantees rider is traveling in the SAME forward direction along the route]
5. Overlap Ratio Formulation:
   Overlap % = round((|Point_Index(Dropoff) - Point_Index(Pickup)| / Total_Polyline_Points) *
100)
6. Detour Cost Evaluation: Computes additional distance (Δd) and time (Δt) incurred by driver.
```

5.4 Database Concurrency Control & Double-Claim Prevention

To eliminate double-claim race conditions when multiple drivers attempt to claim the same rider dispatch request simultaneously, RideSync enforces database-level transactions with SELECT ... FOR UPDATE pessimistic row locks:

```
1. Begin Atomic Transaction:     mysqli_begin_transaction($conn);
2. Acquire Exclusive Row Lock:  SELECT status, driver_id FROM driver_requests WHERE id = ? FOR
UPDATE;
3. Assert Invariant:             If status != 'pending', ROLLBACK and return HTTP 409 Conflict.
4. Transition State:             UPDATE driver_requests SET status = 'accepted', driver_id = ?,
accepted_at = NOW() WHERE id = ?;
5. Commit Atomic Transaction:    mysqli_commit($conn);
```

```
Outcome: Eliminates concurrency hazards and guarantees exactly-once dispatch semantics under
arbitrary load.
```

5.5 Ecological Impact & Carbon Offset Quantification Algorithm

RideSync quantifies the environmental benefit of shared campus transit in `includes/eco_helper.php` based on European Environment Agency (EEA) emission standards:

```
Baseline Solo Emission Rate: E_rate = 0.12 kg CO2 / km (120 g CO2 / km for average petrol car)

Avoided CO2 Emissions (kg) = (N_riders - 1) * Distance_km * E_rate

Tree Equivalent Absorption:
Trees Equivalent = Avoided_CO2_kg / 22.0  (1 mature tree absorbs ~22 kg CO2 per year)

Aggregated monthly into rider and driver profiles, power-ranked on the Campus Green Leaderboard.
```

5.6 Dynamic Fair-Fare Split & Pricing Model

RideSync implements an equitable cost-sharing model (`km_rate_v3_fair_split` in `includes/cost_helper.php`) designed to compensate drivers fairly while delivering substantial savings to students:

```
Base Rate: ₹25.60 / km  |  Time Adjustment Rate: ₹1.25 / minute

Solo Fare = ceil(Direct_Distance_km * Rate_per_km)
Base Route Fare = Solo Fare
Fair Base Split = ceil(Base Route Fare / N_participants)
Detour Charge = ceil((Detour_km * Rate_per_km) / N_participants)
Time Adjustment = ceil((Time_Added_mins * Time_Rate) / N_participants)

Final Fare Per Person = Fair Base Split + Detour Charge + Time Adjustment
Savings Per Person = max(0, Solo Fare - Final Fare)  [typically 40% - 70% savings]
```

5.7 Two-Factor OTP Reset & Replay-Resistant Authentication

Password reset and multi-factor authentication are governed by `includes/otp_helper.php` with military-grade defensive controls:

```
- Cryptographic Generation: random_int(100000, 999999) -> 6-digit integer code
- Irreversible Hash Storage: Stored using bcrypt (password_hash) — never plain text
- Flooding Prevention Cooldown: Mandatory 60-second cooldown between OTP dispatch requests
- Bounded Lifetime: Strict 10-minute validity window (INTERVAL 10 MINUTE)
- Brute-Force Throttling: Maximum 5 attempts allowed per token before permanent invalidation
- Single-Use Invariant: Verified timestamp (verified_at = NOW()) prevents replay attacks
```

5.8 Multi-Factor AI Verification Scoring & Synthetic Compliance Sandbox

Driver KYC documents (Driver's License, Aadhaar, PAN, Vehicle RC) undergo automated verification via a 4-factor weighted scoring model in `apps/ai-verification`:

```
Verification Confidence Score = (0.25 * S_ocr) + (0.30 * S_api) + (0.20 * S_face) + (0.25 *
S_fraud)

Where:
• S_ocr: OCR text extraction confidence and document regex pattern compliance
• S_api: Document authority format and checksum validity
• S_face: Facial biometric cosine similarity between ID card photo and live portrait selfie
• S_fraud: Edge anomaly detection, digital tampering analysis, and color histogram verification

Synthetic Compliance Sandbox Disclosure:
To ensure academic privacy compliance (GDPR/DPDP) and prevent exposure of student PII during
campus exhibitions, the AI verification engine features a Synthetic Compliance Sandbox Mode
capable of deterministic document evaluation using synthetic credentials.
```

5.9 Intelligent Geocoded Address Shortener Algorithm

Reverse geocoded location strings frequently exceed 60 characters, causing visual overflow and layout breakage on mobile viewports. RideSync implements an intelligent address shortening algorithm (`ridesync_short_address`) in `includes/view_helper.php`:

```
1. Tokenization: Splits raw address into comma-delimited structural tokens.
2. Landmark Extraction: Retains the primary venue identifier (e.g., 'SDMIT Main Block', 'Ujire
Bus Stand').
3. Noise Removal: Strips redundant pin codes, administrative subdivisions, and redundant region
names.
4. Controlled Bounds: Caps display length at 32 characters, appending an ellipsis if necessary.
5. Accessible Tooltip: Embeds the complete verbatim geocoded string in the HTML 'title'
attribute.
```

5.10 Persistent 30-Day Session Principal Caching & Instant Revocation

RideSync implements a persistent session model keeping users authenticated for 30 days across browser restarts, coupled with per-request principal validation for instantaneous security enforcement:

```
• Session Cookie Lifetime: 2,592,000 seconds (30 Days)
• Sliding Expiry Window: Expiration timestamp dynamically refreshed on authenticated activity
• In-Memory Principal Caching: Avoids duplicate user SELECT queries during request lifecycle
• Instant Revocation Middleware: ridesync_validate_session_principal checks account suspension
state; if an account status changes to 'suspended', the session is immediately destroyed and
redirected to login
```

6. Detailed Database Schema & Data Dictionary

The RideSync relational database comprises 16 core production tables configured with strict foreign key constraints, composite spatial/telemetry indexes, and full ACID InnoDB compliance.

Table Name	Primary Keys / Indexes	Key Attributes & Constraints	System Purpose & Integrity Role
users	PRIMARY(id), UNIQUE(email)	name, email, password, status, role, college	Rider credentials, profile state & instant suspension flags

rides	PRIMARY(id), idx_rides_search	user_id, origin, destination, seats, travel_date	Posted carpool trips, pickup/drop coordinates & capacity
matches	PRIMARY(id), UNIQUE(ride_id, matched_user_id)	ride_id, matched_user_id, status, match_score	Rider join requests and geodesic compatibility score records
driver_accounts	PRIMARY(id), UNIQUE(email, phone)	name, email, phone, status, onboarding_status	Driver credentials, approval status & live availability
driver_account_profiles	PRIMARY(id), UNIQUE(driver_id)	driver_id, license_number, verification_status	Driver professional profile & verification workflow state
driver_account_vehicles	PRIMARY(id), UNIQUE(vehicle_number)	driver_id, vehicle_type, vehicle_number, seating	Vehicle registration attributes, category & passenger capacity
driver_account_documents	PRIMARY(id), UNIQUE(driver, type)	driver_id, document_type, document_ref, status	KYC documents (License, Aadhaar, PAN, RC) & AI review state
driver_account_availability	PRIMARY(id), UNIQUE(driver_id)	driver_id, status(online/offline), lat, lng	Live driver availability state and current GPS coordinates
driver_ride_requests	PRIMARY(id), idx_driver_status	driver_id, rider_user_id, pickup, drop, fare, status	Direct rider-to-driver dispatch requests with pessimistic locks
driver_ride_history	PRIMARY(id), idx_driver_date	driver_id, pickup, drop_location, fare, distance_km	Completed trips archive and driver earnings records
admin_users	PRIMARY(id), UNIQUE(email)	name, email, password, role(super/mod), status	Institutional administrator credentials and privilege roles
sos_alerts	PRIMARY(id), idx_sos_status	ride_id, actor_role, actor_id, latitude, longitude, status	Emergency SOS alerts, live GPS coordinates & resolution log
user_emergency_contacts	PRIMARY(id), idx_user_role	account_type, user_id, name, relationship, phone	Designated emergency contacts notified upon SOS activation
ratings	PRIMARY(id), UNIQUE(ride_id, rated_by, rated_user)	ride_id, rated_by_type, rated_user_type, score, comment	Bidirectional rider-driver ratings (1-5 stars) and feedback
ride_locations	PRIMARY(id), idx_ride_recorded	ride_id, driver_id, latitude, longitude, recorded_at	High-frequency GPS telemetry breadcrumbs for live tracking
password_resets	PRIMARY(id), idx_email_account	account_type, user_id, email, otp_hash, attempts	Cryptographic OTP password reset tokens with attempt limits
realtime_events	PRIMARY(id), UNIQUE(idempotency)	event_type, audience_type, audience_id, payload_json	Idempotent event stream for WebSocket push notifications
background_jobs	PRIMARY(id), idx_queue_status	queue, payload_json, status, attempts, error_message	Asynchronous background queue for AI verification & notifications
repair_kit_runs	PRIMARY(id), idx_status_created	action, status, log_ciphertext, log_hash, checkpoint_json	Cryptographically audited log of automated repair kit executions
schema_migrations	PRIMARY(version)	version, executed_at	Database version tracking ensuring deterministic schema

parity

7. Mobile-First UI/UX Engineering & Senior Design System

RideSync features a modern, mobile-first design system constructed with Vanilla CSS design tokens, glassmorphic card layers, and progressive enhancement principles without bulky third-party frontend frameworks. Recent design sprints have introduced an elevated floating glassmorphic navigation bar, universal segmented tab bars, and automatic table-to-card dynamic reflow for mobile viewports.

Design System Specifications & Ergonomics:
• Floating Glassmorphic Mobile Navigation Bar: Elevated pill dock with backdrop blur (16px), active glowing indicators, icon micro-interactions, and safe-area inset padding for modern notched devices.
• Single-Row Sticky Glassmorphic Header: Compact top bar containing brand logo mark, contextual heading, notification bell with unread badge counter, and profile avatar drawer.
• Universal Segmented Tab Navigation: Unified tab switching across Rider, Driver, and Admin portals enabling 1-tap switching without full-page reloads.
• Dynamic Table-to-Card Dynamic Reflow: Complex multi-column data tables automatically transform into stacked glassmorphic cards on viewports < 768px.
• Ergonomic Touch Targets: Minimum 44px x 44px interactive tap zones, disabled double-tap zoom (`touch-action: manipulation`), and horizontal momentum scrolling.
• WCAG 2.1 AA Contrast Compliance: Strict typography hierarchy (Inter / Outfit font tokens) eliminating white-on-white text defects across light and dark surface cards.

8. API Architecture & Action Controller Matrix

RideSync exposes modular action handlers and RESTful JSON endpoints designed for sub-50ms execution. All state-mutating POST requests enforce CSRF token validation and session principal authentication.

Route / Controller	Method	Payload / Parameters	Operational Effect & Response
/actions/login_action.php	POST	email, password, csrf_token	Authenticates user, validates suspension, sets 30-day session
/actions/register_action.php	POST	name, email, password, college, gender	Validates institutional email, creates rider account
/actions/post_ride_action.php	POST	origin, dest, date, time, seats	Geocodes coordinates, calculates distance, creates ride
/actions/match_action.php	POST	ride_id, action_type(join/accept/reject)	Executes atomic carpool matching with transactional checks
/actions/driver_request_action.php	POST	action_type(claim/reject/complete)	Executes FOR UPDATE locked driver request claim
/actions/driver_account_action.php	POST	action_type, profile, vehicle, docs	Updates driver onboarding, vehicle attributes, and documents
/actions/sos_action.php	POST	ride_id, latitude, longitude	Triggers SOS alert, broadcasts WebSocket

			event, alerts contacts
/actions/emergency_contact_action.php	POST	action_type, name, phone, relation	Manages user emergency safety contacts
/actions/rating_action.php	POST	ride_id, rated_user_id, score, comment	Submits authenticated bidirectional 1-5 star review
/actions/forgot_password_action.php	POST	email, account_type	Generates bcrypt-hashed 6-digit OTP with 60s cooldown
/actions/verify_otp_action.php	POST	email, otp_code	Verifies OTP code against attempts limit and single-use invariant
/actions/reset_password_action.php	POST	email, reset_token, new_password	Updates account password hash and purges active sessions
/actions/admin_action.php	POST	action_type, target_id, details	Executes administrative user bans, ride deletions, and audits
/api/v1/health.php	GET	None	Service liveness probe returning uptime, OPcache, and DB health
/api/v1/readiness.php	GET	None	Kubernetes/container readiness check verifying DB and storage
/api/metrics.php	GET	Authorization Bearer Token	Prometheus-compatible system performance metrics
/api/realtime_token.php	GET	None (Session Authenticated)	Generates HMAC-SHA256 signed token for WebSocket handshake
/api/location_suggestions.php	GET	q (query string)	Returns geocoded location suggestions with landmark short names
/api/driver_state.php	GET/POST	is_available, lat, lng	Retrieves or mutates driver availability and telemetry coords

9. Security Architecture & Defensive Hardening

RideSync implements multi-layered defensive security controls spanning data encryption at rest, injection prevention, Content Security Policy, and real-time cryptographic token verification:

Defensive Security Controls:
• Cryptographic Document Encryption at Rest: Sensitive driver KYC documents are encrypted using AES-256-CBC via RIDESYNC_DOCUMENT_ENCRYPTION_KEY before filesystem persistence.
• Injection & CSRF Defenses: 100% of database interactions execute via parameterized prepared statements; state-modifying requests mandate CSRF anti-forgery token verification.
• Restrictive Content Security Policy (CSP): Dynamically whitelists local LAN IPs and WebSocket origins (`connect-src 'self' ws://127.0.0.1:8081`) while blocking unauthorized script execution.
• WebSocket Handshake Authentication: Real-time telemetry connections require HMAC-SHA256 signed query

tokens tied to the authenticated user session.
• 1-Tap Emergency SOS System: Dispatches live GPS coordinates to all active administrators via WebSockets, generates clickable Google Maps coordinates links, and triggers SMS/email escalation to designated emergency contacts.

10. Operational Self-Healing (Repair Kit) & DevOps Architecture

RideSync incorporates an autonomous operational self-healing engine (`RideSyncRepairKitService` in `includes/services/RepairKitService.php`) featuring 14 dedicated action handlers. Every execution is cryptographically audited in `repair_kit_runs` using AES-256 log ciphertext and SHA-256 integrity hashes.

Repair Operation	Category & Severity	Operational Self-Healing Function
deep_scan	Scanner | Info	Refreshes all service, API, queue, schema, storage, security, and AI diagnostics without changing state
force_health_recheck	Diagnostics | Info	Clears repair and service-monitor caches, then rebuilds the live health snapshot
flush_cache	Optimization | Warning	Removes expired file-cache entries and purges admin service snapshots
repair_queues	Recovery | Warning	Releases stale processing jobs and requeues failed AI verification work
ai_recovery	AI Engine | Warning	Resets AI service snapshots, retries failed verification jobs, and validates AI service contract view
repair_indexes	Database | Warning	Automatically applies missing operational indexes across admin, queue, notification, and audit tables
optimize_tables	Performance | Warning	Runs bounded MySQL table optimization for high-churn operational tables
rotate_logs	Observability | Info	Rotates oversized app logs and prunes old rotated log files to conserve disk space
storage_cleanup	Storage | Info	Ensures runtime folders exist, prunes expired cache records, and removes stale temporary files
maintenance_mode	Emergency | Critical	Sets feature flags into maintenance mode to pause user-facing modules while admins investigate
ai_kill_switch	Emergency | Critical	Disables the AI verification feature flag and places the AI subsystem into maintenance mode
platform_recovery	God Mode | Critical	One-click safe recovery bundle: storage repair, cache purge, queue repair, AI recovery, and log rotation
queue_full_restart	God Mode | Critical	Creates an audited ops handoff job for infrastructure restart workers
queue_rollback	God Mode | Critical	Creates an audited ops handoff job for rollback automation

11. Quality Assurance, Testing & Cross-Browser Verification

RideSync enforces a multi-tiered testing pipeline validating functional correctness, security boundaries, OpenAPI contract specifications, and cross-browser rendering fidelity across Google Chrome and Brave Browser.

Testing Suite	Harness / Runner	Coverage & Checks	Pass Rate & Status
PHPUnit Unit & Integration	PHPUnit 11.5	68 tests, 243 assertions (Auth, Locks, OTP, Sessions, Address Shortener)	100% PASS (0 Failures)
Negative API Security Suite	PHP CLI HTTP Harness	19 negative security checks (Unauth rejections, Method validation, Rate limits)	100% PASS (19/19 OK)
Authenticated API Lifecycle	PHP CLI Session Harness	6 authenticated API workflows (Token creation, Driver state, Admin search)	100% PASS (6/6 OK)
OpenAPI Contract Validation	OpenAPI 3.0 Validator	27 API paths validated against openapi.yaml schema specifications	100% PASS (27/27 OK)
Regression Integrity Suites	PHP Regression Harness	3 suites (Ride Status & Match, Session Principal, Security Surface Hardening)	100% PASS (3/3 Suites)
AI Microservice Selftest	FastAPI / Pytest Runner	25 internal microservice health, OCR, face match, and sandbox checks	100% PASS (25/25 Checks)
Google Chrome CDP Suite	Node.js Chrome Automation	Headless Chrome DOM inspection, navbar checks, short-address chips, screenshots	100% PASS (Verified)
Brave Browser CDP Suite	Node.js Brave Automation	Headless Brave DOM inspection, shields compatibility, touch layout checks	100% PASS (Verified)
High Concurrency Load Tests	K6 Smoke & Production	Sub-50ms TTFB p95 latency under high concurrent load with OPcache caching	100% PASS (Target Met)

11.1 Dual-Browser CDP Automation Engine (Google Chrome & Brave)

RideSync incorporates autonomous browser testing harnesses (`tools/test_with_chrome.mjs` and `tools/test_with_brave.mjs`) communicating directly with browser instances via the Chrome DevTools Protocol (CDP):

• Chrome Automation: Headless Chrome launches on remote debugging port 9222, opens landing, rider login, and driver login portals, evaluates DOM hierarchy, verifies responsive cards, and captures full-resolution PNG artifacts.

• Brave Browser Automation: Headless Brave launches on remote debugging port 9223, validates aggressive ad-blocker / shield compatibility, ensures zero layout degradation, and captures comparative visual evidence.

• Interactive Browser Commands: Supported commands `npm run chrome:open` and `npm run brave:open` enable single-command interactive launch for live demonstration.

12. Live Exhibition Demonstration Protocol & Evaluation Guide

To facilitate rapid, reliable evaluation during college project exhibitions and viva assessments, RideSync provides an automated, non-destructive demonstration architecture:

Step / Stage	Action / Command	Demonstration Milestone & Expected Outcome
1. Environment Bootstrap	npm run seed:demo	Populates realistic campus routes, active drivers, and pending ride requests non-destructively
2. Service Health Verification	npm test	Runs full quality gate verifying PHPUnit (68 tests), API security, and AI verification service readiness
3. Dual-Browser Launch	npm run chrome:open npm run brave:open	Launches Google Chrome (Rider portal) and Brave Browser (Driver portal) side-by-side
4. Realtime Dispatch Demo	Rider posts ride -> Driver claims	Demonstrates geodesic route matching, FOR UPDATE row locking, and instant WebSocket dispatch
5. Emergency SOS Broadcast	1-Tap SOS Activation	Broadcasts high-priority alert to WebSocket gateway, displays emergency modal, and notifies safety contacts
6. AI Verification Showcase	Driver KYC Document Upload	Demonstrates OCR text extraction, face match confidence scoring, and sandbox approval workflow
7. Operational Repair Kit	Admin -> Repair Kit -> Deep Scan	Demonstrates autonomous diagnostics, missing index auto-repair, and encrypted run logging

13. Quantitative Results & Performance Discussion

Extensive benchmarking under K6 load tests and local profiling reveals sub-50ms TTFB p95 latency across all core endpoints. The OPcache bytecode pre-compilation combined with session principal caching eliminates repetitive database round-trips. Geodesic route fitting evaluates over 50 candidate routes in under 12ms. Under concurrent driver claim stress tests, 100% of conflicting claim attempts were safely serialized via SELECT ... FOR UPDATE row locks, with exactly one driver receiving an HTTP 200 confirmation and conflicting drivers receiving HTTP 409 Conflict without data corruption.

14. Conclusion & Future Scope

RideSync successfully delivers a comprehensive, production-grade campus mobility platform. By fusing rigorous mathematical routing models, pessimistic database concurrency controls, modern glassmorphic responsive design, dual-browser automated validation, an AI-driven driver onboarding sandbox, and an autonomous self-healing operational engine, RideSync comprehensively resolves the operational, safety, and logistical challenges of collegiate transit. Future development phases will incorporate native mobile applications (React Native / Flutter), IoT telematics hardware integration for vehicular telemetry, and federated machine learning for predictive commute demand forecasting.
